*Abstract Session 3.3 – How to change for global change: Finding reflexive leverage points in transdisciplinary research on climate change and forests in local contexts.*

This article develops the concept of reflexive leverage points for transformation at the forest-climate nexus, from a local perspective, based on a transdisciplinary workshop with forest stakeholders in Sweden. The forest-climate nexus is tied to adaptation and mitigation strategies for global climate change, but it also relies on changes on the local level, where actors, institutions, and relations encompass multiple layers and long temporal horizons. The notion of reflexive leverage points brings the leverage points perspective into a dialogue with reflexivity. The workshop participants saw leverage, in the future, as lying mainly in technological innovation and increased material flows. In past transformations, pluralist values and cooperation were seen as crucial leverage. Reflection on the participants' experiences of past transformations leads to the identification of reflexive leverage points that are not overshadowed by present-day global discourses on climate change, and they might support effective local action and, as a result, system change as a way to adapt to and mitigate global climate change.
